

Full potential feature list (All free to add as many as you can think of):

- Option for ingredients in cups and weight
- Full health diagnostics per meal and per meal cycle
- Pictures as well as list options for ingredients selection
- Filters for: num-people/diet/dislikes/allergies/num-of-meals-per-day/snacks/preferences/vitamins/low-fat/high-protein
- Meal selections as list or pictures or both of descriptions or change order of the list, preferences first etc
- Options to choose all dinners and then lunches and then breakfasts etc if that option is selected
- Current ingredients have info on how long they usually last
- Can view current ingredients as pictures or as a list and order them by where they are usually stored or under headings/sub-headings
- Quick access button called let's cook -> that takes straight to meals and orders them in what will be best to eat fresh etc, or if the user has selected days for items to be eaten, the app auto brings up the selected meal when lets cook is pressed
- Stats and badges -> users build up a relationship with the service and desire to eat more healthy to earn badges
- Users can add meals and get rated by other users -> earning chef stars -> links to badges
- User forum for health and cooking tips
- Users can share healthy eating progress
- Animated icons - have a builder
- Typical price of recipe

Specifically targeting towards students:

- Price
- A section that has recipes with similar ingredients so can plan weekly meals
- How many portions are included & how to store and reheat
- Rating of how easy a recipe is

Options for operating mechanics:

- Two sections of the app:
  - One side is meal selections and options with filters for choosing meal -> can like each meal to a current meal plan or just search meals to make etc
  - Second side is your meal planner -> filter for desired meals (veggie, vegan, how many people will be eating, how many days to cycle, what you want to eat, how many meals a day (breakfast lunch and dinner)) -> meal selection comes up and you choose meals for each day for the number of people with requirements -> current ingredients with their average shelf life in brackets (options to have this selection in picture format or tick boxes with ingredients in list) -> given a shopping list than can be accessed in the app or exported (users can add extra items to the list and has the ability to tick them off in the shop, each item ticked off is then saved with the items already in stock saved as ticked boxes) -> users can then open the app with their selection given to them as options with recommendations for how long food lasts etc

Ideas for names:

- Scran plan

- My meal plan
- My meals
- Cookout collection
- Cookout catalogue
- Eating Inventory
- Meal Methods
